Hiring Team
Nomba

Application for Site Reliability Engineer

Dear Hiring Team,

I am writing to apply for the Site Reliability Engineer role at Nomba. I am a software engineer with more than five years of experience building and supporting web, backend, and mobile products. My work has involved developing production applications, designing APIs and data systems, troubleshooting service issues, and improving the reliability of the systems behind user-facing products. I am interested in bringing that practical engineering experience to a fintech platform operating at Nomba's scale.

In my role at Earncentive, I develop and maintain applications across frontend and backend services, integrate external platforms such as payment gateways, and work through testing, debugging, and performance issues. I have also worked with Python, Django, Flask, Node.js, PostgreSQL, MySQL, Redis, and Linux. This combination has given me a useful understanding of how application code, data stores, integrations, and the underlying runtime environment affect the reliability of a complete service.

I have also taken responsibility for building and operating products beyond feature development. Through my work on FLINK and other applications, I have dealt with backend services, asynchronous workers, WebSocket-based functionality, deployment processes, server logs, and production troubleshooting in Linux environments. At Mattys Inc., I led development of a web application serving more than 100,000 users, built REST APIs with Django REST Framework, improved database query performance by 40%, and implemented a GitHub Actions CI/CD pipeline. These experiences have strengthened my ability to investigate failures, identify bottlenecks, and make changes that improve system behaviour.

What attracts me to Nomba is the engineering challenge behind dependable financial infrastructure. When businesses and individuals rely on a platform for payments and everyday financial operations, availability, security, observability, and disciplined incident response are essential. I would welcome the opportunity to work closely with your engineering teams to improve operational visibility, automate repeatable tasks, strengthen deployment practices, and build systems that remain dependable as usage grows.

I bring a strong foundation in Python and Linux-based systems, practical experience with databases and production application support, and a product-minded approach to engineering. I am also committed to deepening my expertise in formal SRE practices and infrastructure automation. I would appreciate the opportunity to discuss how my background could contribute to Nomba's reliability and infrastructure goals.

Thank you for your time and consideration.

Yours sincerely,

Chima Chidiebere Sunday
